Daily Log

Monday November 18

I downloaded miniconda and read about how to use it to try and mitigate the problems I was having with version control.

Tuesday November 19

I realized that the data I was feeding in to my code was formatted completely wrong when I was reading an article on Deep Feed Forwards NNs. The data needs to be put in with the categorical data on the first column on the left, and the numbers on the right with no header. I had the headers in and spaces in between.

Thursday November 22

I worked on fixing the data some more and got it mostly all done. I also fixed some other issues I had in my code, and continued to refine it based on the article I was reading.

Timeline

Date	Goal	Met
Nov 18	Continue the model. Finish a preliminary version of the code so I can try and compile and debug if necessary	Yes, and I am currently trying to debug my program.
Nov 25	Try to fix the version control issues.	No, I started working on it with miniconda though.
Dec 2	Fix all data imports and run the model to see if I produce any sort of intelligible result. If I am getting errors, try to fix those so I can rerun it the following week.	Yes, but now I am trying to fix the data so I can actually get good results and also fix the version control problem.
Dec 2	Get results to be within 40 percent of the actual results.	
Dec 2	Get results to be within 30 percent of the actual results.	

Reflection

I found a big problem in the way I was expecting my code to work before, since I was inputting the data in the wrong way. I am also continuing to try and fix the version control problem. If I am able to fix that, I will definitely meet my winter goal.
